

FastPlate™ Fixed ALPR

Automatic License Plate Recognition

Accurately capture, read, and analyze!

FastPlate™ Fixed Automatic License Plate Recognition System (ALPR) accurately captures and processes license plate information on moving vehicles. Automatic License Plate Recognition (ALPR) technology “reads” individual vehicle plates using optical character recognition (OCR) which is the camera’s ability to scan the license plate images for letters and numbers, and then translate those images into usable data. The ALPR system runs continuously and captures license plates in nearly every lighting condition.

FastPlate™ Fixed ALPR gives security and law enforcement officials an efficient method of monitoring, documenting, comparing, and storing captured vehicle information. Users are presented with on-screen vehicle information including registered drivers, stored master video/images, and alerts if the vehicle is registered on a “be on look out”/BOLO list or stolen vehicle database. The FastPlate™ system features detailed reporting capabilities that allow security staff to customize reporting based on immediate needs.

The FastPlate™ Fixed ALPR can be configured to manage access points that have entrance/exit access control using a FastPlate™ Fixed ALPR can be configured using various cameras, therefore the system is tailored to fit any functional need or specific location requirements.

- >> “Read” & analyze plates
- >> Compare findings to BOLO list or stolen vehicle databases

- >> Works in nearly all lighting
- >> On-Screen alerts
- >> ALPR great for access gates
